

3. ReactJS-HOL

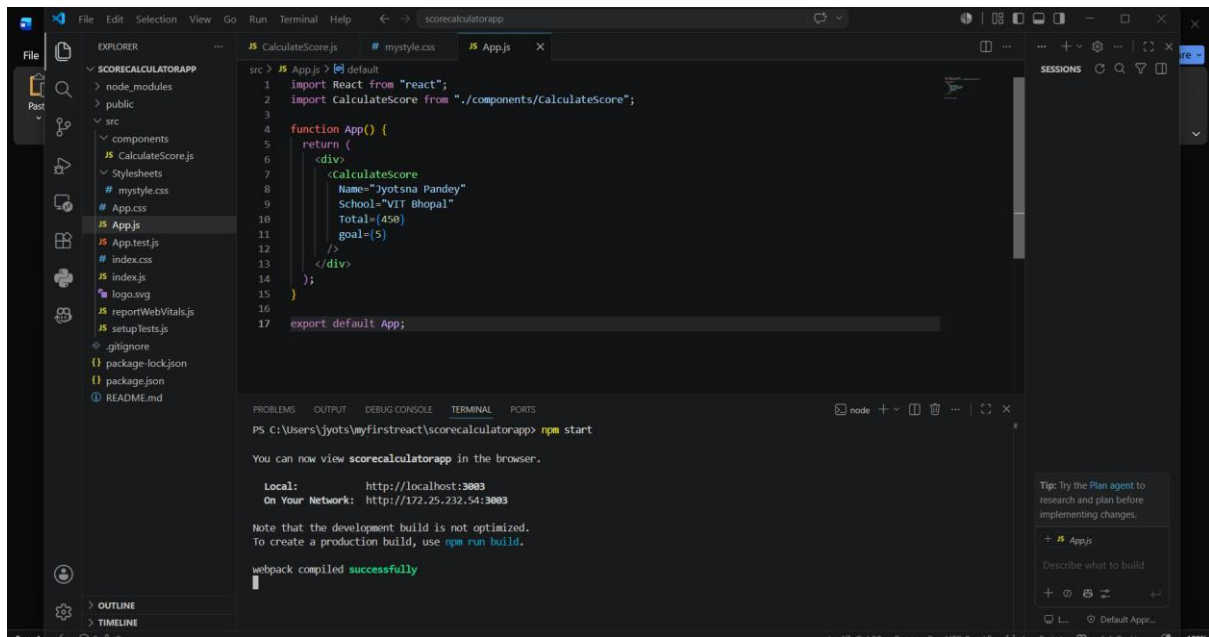

Objectives

- Explain React components
- Identify the differences between components and JavaScript functions
- Identify the types of components
- Explain class component
- Explain function component
- Define component constructor
- Define render() function

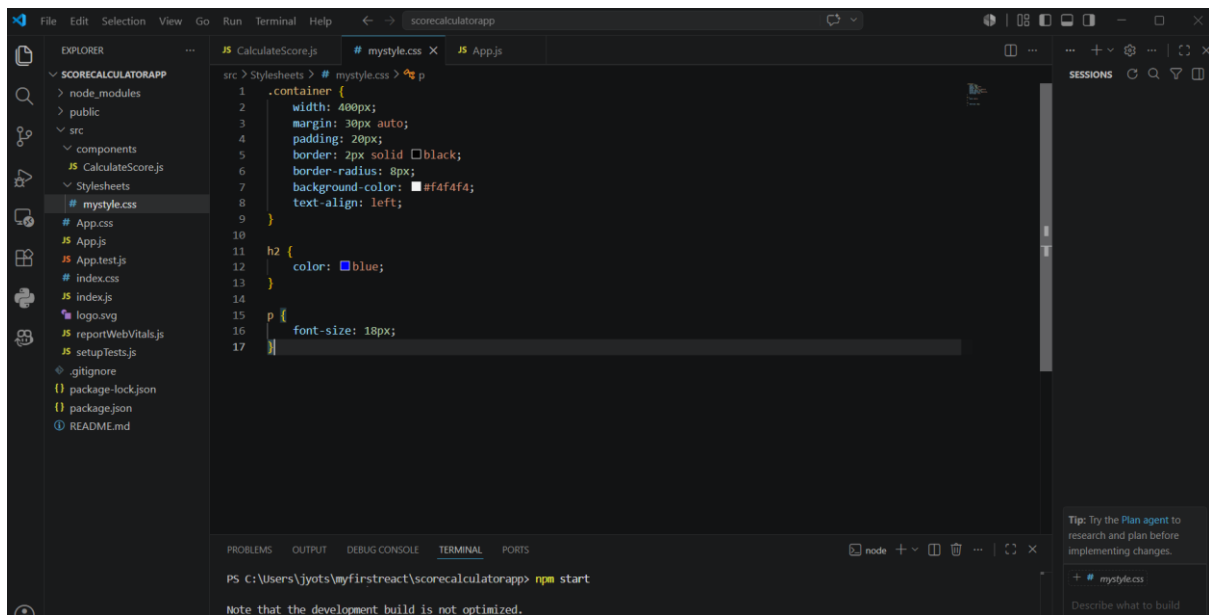

In this hands-on lab, you will learn how to:

- Create a function component
- Apply style to components
- Render a component

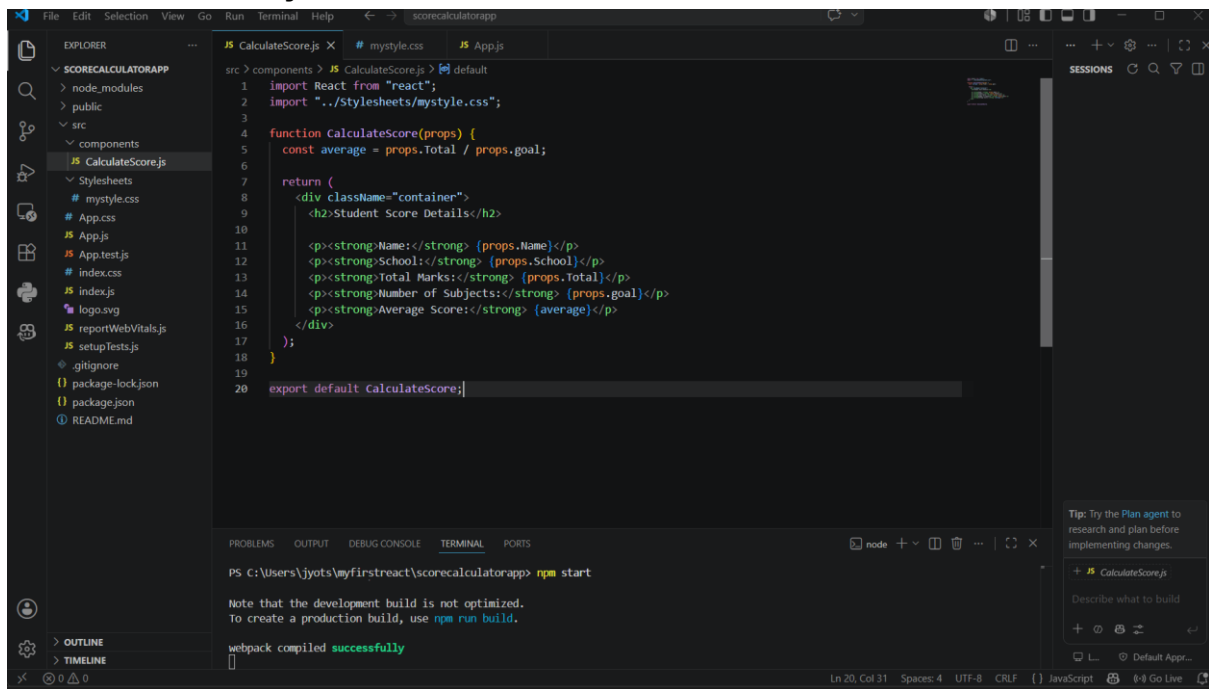

App.js

Mystyle.css

CalculateScore.js

The screenshot shows a VS Code editor window with the file `CalculateScore.js` open. The file contains the following code:

```
1 import React from "react";
2 import "../Stylesheets/mystyle.css";
3
4 function CalculateScore(props) {
5   const average = props.Total / props.goal;
6
7   return (
8     <div className="container">
9       <h2>Student Score Details</h2>
10
11       <p><strong>Name:</strong> {props.Name}</p>
12       <p><strong>School:</strong> {props.School}</p>
13       <p><strong>Total Marks:</strong> {props.Total}</p>
14       <p><strong>Number of Subjects:</strong> {props.goal}</p>
15       <p><strong>Average Score:</strong> {average}</p>
16     </div>
17   );
18 }
19
20 export default CalculateScore;
```

The terminal at the bottom shows the command `npm start` being executed, resulting in the message: `webpack compiled successfully`. A note in the terminal states: "Note that the development build is not optimized. To create a production build, use `npm run build`."

Output

Student Score Details

Name: Jyotsna Pandey

School: VIT Bhopal

Total Marks: 450

Number of Subjects: 5

Average Score: 90
